

Preparing physics teachers for 21st century

Eugenia Etkina
Rutgers University
Graduate School of Education
New Brunswick, NJ, USA
eugenia.etkina@gse.rutgers.edu

A teacher needs to know...

Physics itself

**How do we
help students
learn
physics?**

**How people
learn**

A teacher needs to know...

Physics itself

Not just laws and other equations but HOW physicists think – **how** they come up with these equations and laws and how they convince each other

How do we help students learn physics?
Wealth of knowledge created in PER

How people learn

We know a lot now, and most important is that people learn by actively participating in the collaborative construction of knowledge –
STUDENT
CENTERED
APPROACH

A teacher needs to know...

Physics itself

Not just content—the final outcomes of physics process but the process itself – the process is hidden in the practices and cross-cutting concepts of the NGSS

How do we help students learn physics?

Specific strategies and tools (representations), assessment methods and lots more

How people learn

Knowledge about the brain, embodied cognition, gender composition of groups, identity development (impostor syndrome, learned helplessness, etc.)

Three crucial issues

The only element of teacher preparation programs that can predict how new teachers will actually teach is the amount of experience with every day instruction relevant to the first year of their teaching received in the program (Boyd et al., 2009).

D. Boyd, P. Grossman, H. Lankford, S. Loeb, & J. Wyckoff, “Teacher preparation and student achievement,” *Educational Evaluation and Policy Analysis*, **31**, 416-439, (2009).

Three crucial issues

The only element of teacher preparation programs that can predict how new teachers will actually teach is the amount of experience with every day instruction relevant to the first year of their teaching received in the program (Boyd et al., 2009).

Teachers experience difficulty implementing student-centered teaching (*instruction consistent with NGSS*), despite being taught to do so during pre-service preparation (Simmons et al., 1999).

P.E. Simmons, A. Emory, T. Carter, T. Coker, B. Finnegan, D. Crockett, “Beginning teachers: Beliefs and classroom actions,” *Journal of Research in Science Teaching*, **36**, 930-954 (1999).

Three crucial issues

The only element of teacher preparation programs that can predict how new teachers will actually teach is the amount of experience with every day instruction relevant to the first year of their teaching received in the program (Boyd et al., 2009).

Teachers experience difficulty implementing student-centered teaching, despite being taught to do so during pre-service preparation (Simmons et al., 1999).

The feeling of isolation is one of the primary reasons for teachers to leave the profession (Darling-Hammond, 2001).

L. Darling-Hammond, "The challenges of staffing our schools," *Educational Leadership*, **58**, 12-17 (2001).

Three crucial issues

The only element of teacher preparation programs that can predict how new teachers will actually teach is the amount of experience with every day instruction relevant to the first year of their teaching received in the program (Boyd et al., 2009)

Teachers experience difficulty implementing student-centered teaching, despite being taught to do so during pre-service preparation (Simmons et al., 1999).

The feeling of isolation is one of the primary reasons for teachers to leave the profession (Darling-Hammond, 2001).

What should we do?

Issue #1

The only element of teacher preparation programs that can predict how new teachers will actually teach is the amount of experience with every day instruction relevant to the first year of their teaching received in the program.

Preparation for every day instruction

Physics curriculum (order of topics)

What do we want students to learn and be able to do in each topic? Why?

How will we know that they actually learned it?

What do we know about students' ideas in this area?

What are productive representations and learning approaches for this particular topic?

What should students know “for sure” to be able to succeed today?

What are good resources? What aspects of those resources match my teaching philosophy?

What will happen in class today? Tomorrow?

Decisions on all of those depend on teacher's beliefs about teaching

Beliefs: can all students learn physics? Do they come to class full of misconceptions of productive resources? Is learning a quantum state: got it or did not get it?

These are just a few examples. These become as important as the knowledge listed above – EVERY DAY!

It takes time to learn all this, right?
How much time? How many courses?

Rutgers University Teacher Preparation Program has 6 courses over 2 years in which students who already have a physics degree learn to teach physics:

1. Every topic of the curriculum – at least twice
2. Technology, experimentation, assessment, curriculum design – all included

Course work in the Rutgers Physics Program in the Graduate School of Education

Master's Program (45 Credits)

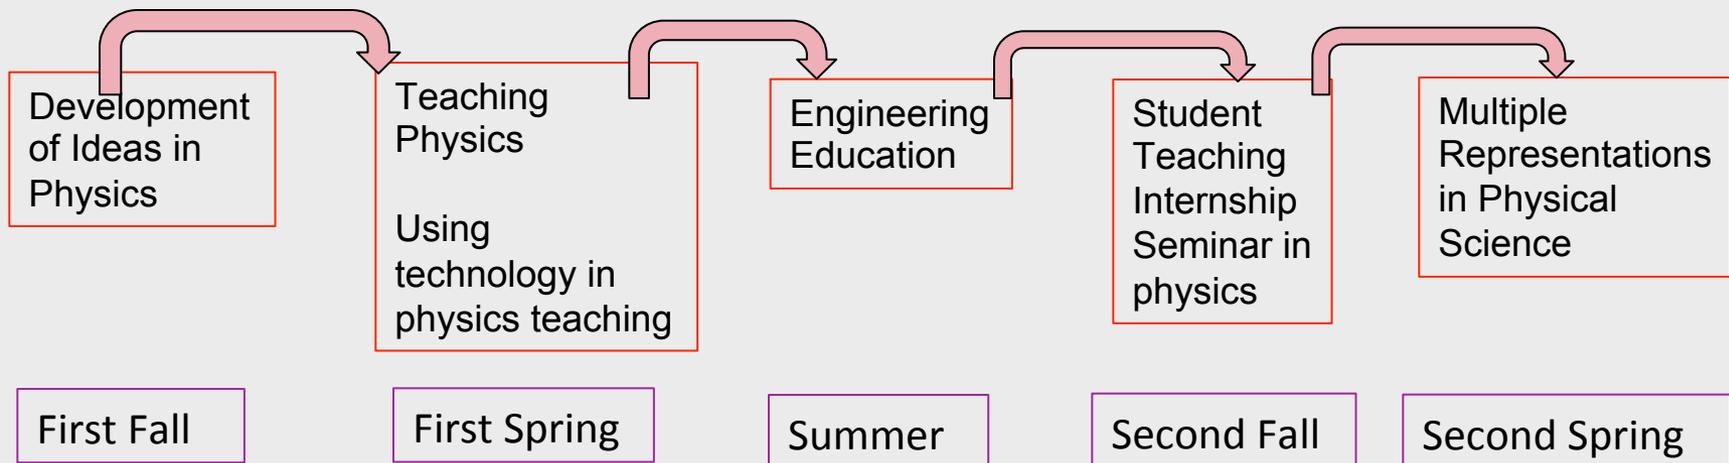

5 semesters with 6 physics teaching methods courses
(two years with summer between)

Course work in the Rutgers Physics Program in the Graduate School of Education

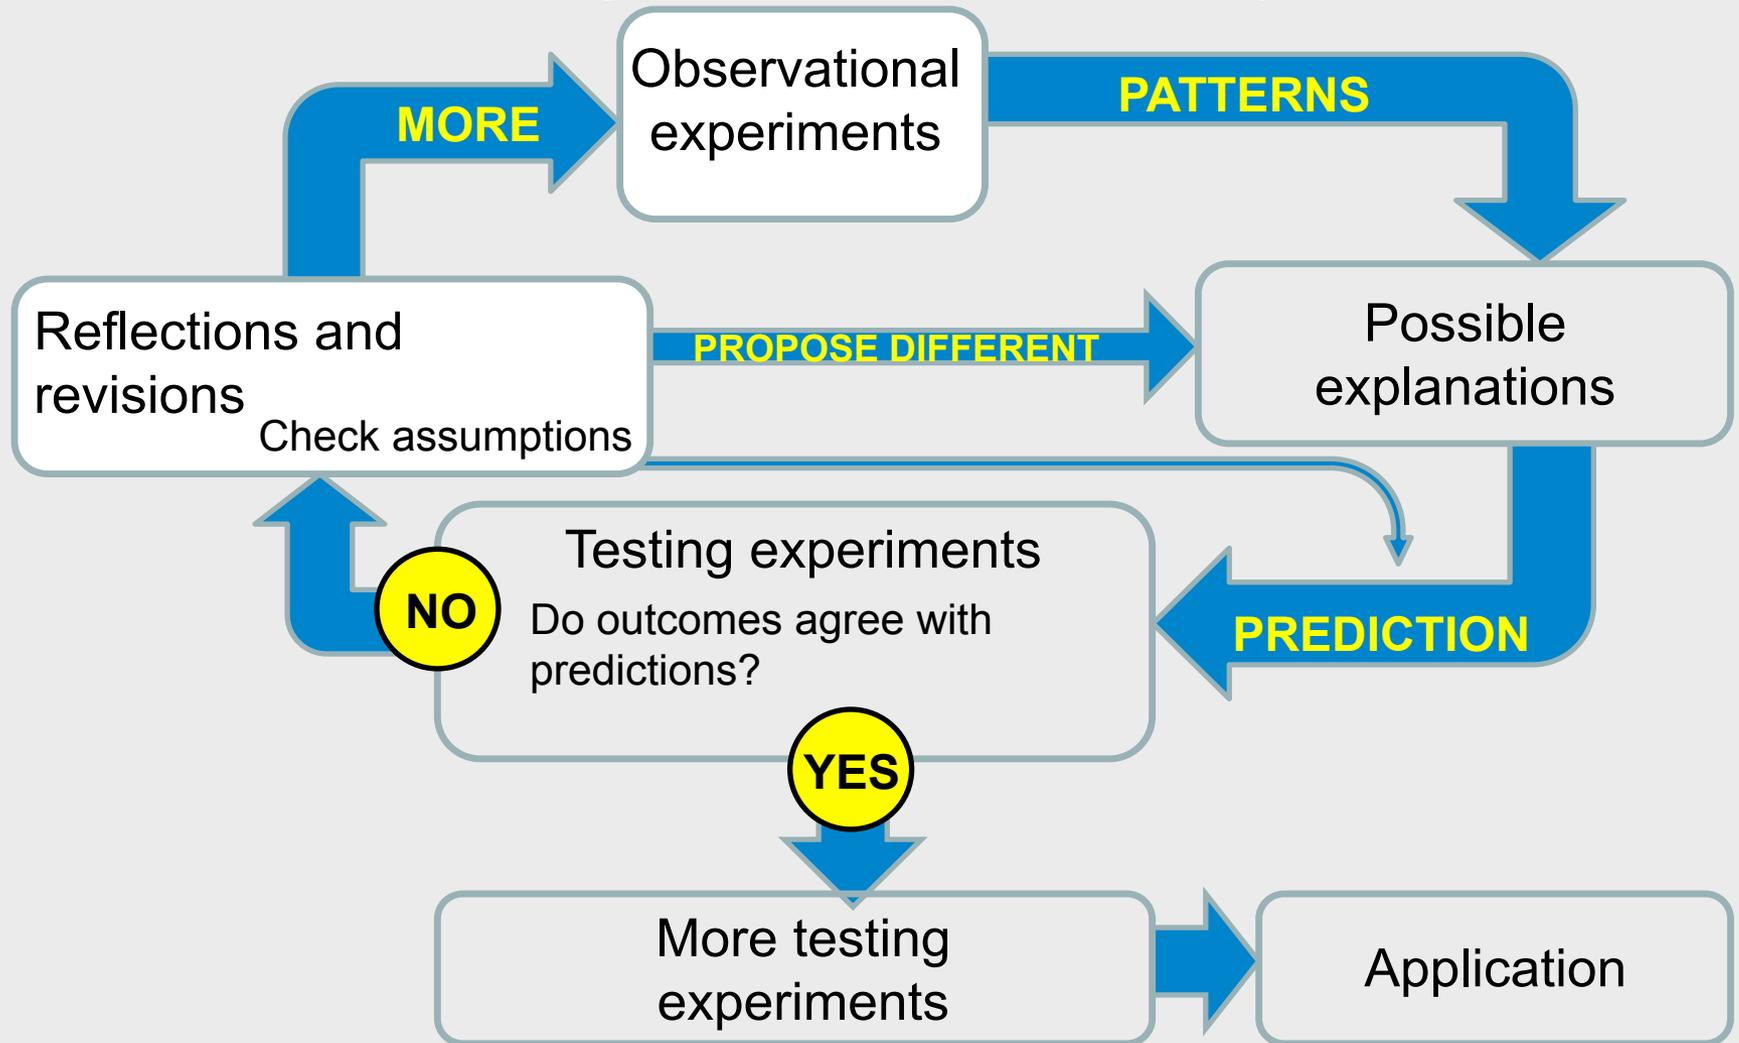

Master's Program (45 Credits)

5 semesters with 6 physics teaching methods courses
(two years with summer between)

PHYSICS TEACHING METHODS COURSES

Same framework for all courses: Investigative Science Learning Environment - ISLE cycle

ISLE as a philosophy of teaching and learning physics naturally incorporates development of science practices into student learning of physics and “coincidentally” has the same cross-cutting concepts that are ubiquitous through the ISLE-based curricula that pre-service teachers use.

Issue #2

Teachers experience difficulty implementing student-centered teaching, despite being taught to do so during pre-service preparation (Simmons et al., 1999).

Making student-centered teaching a habit of new teachers

Cognitive apprenticeship

Independent practice

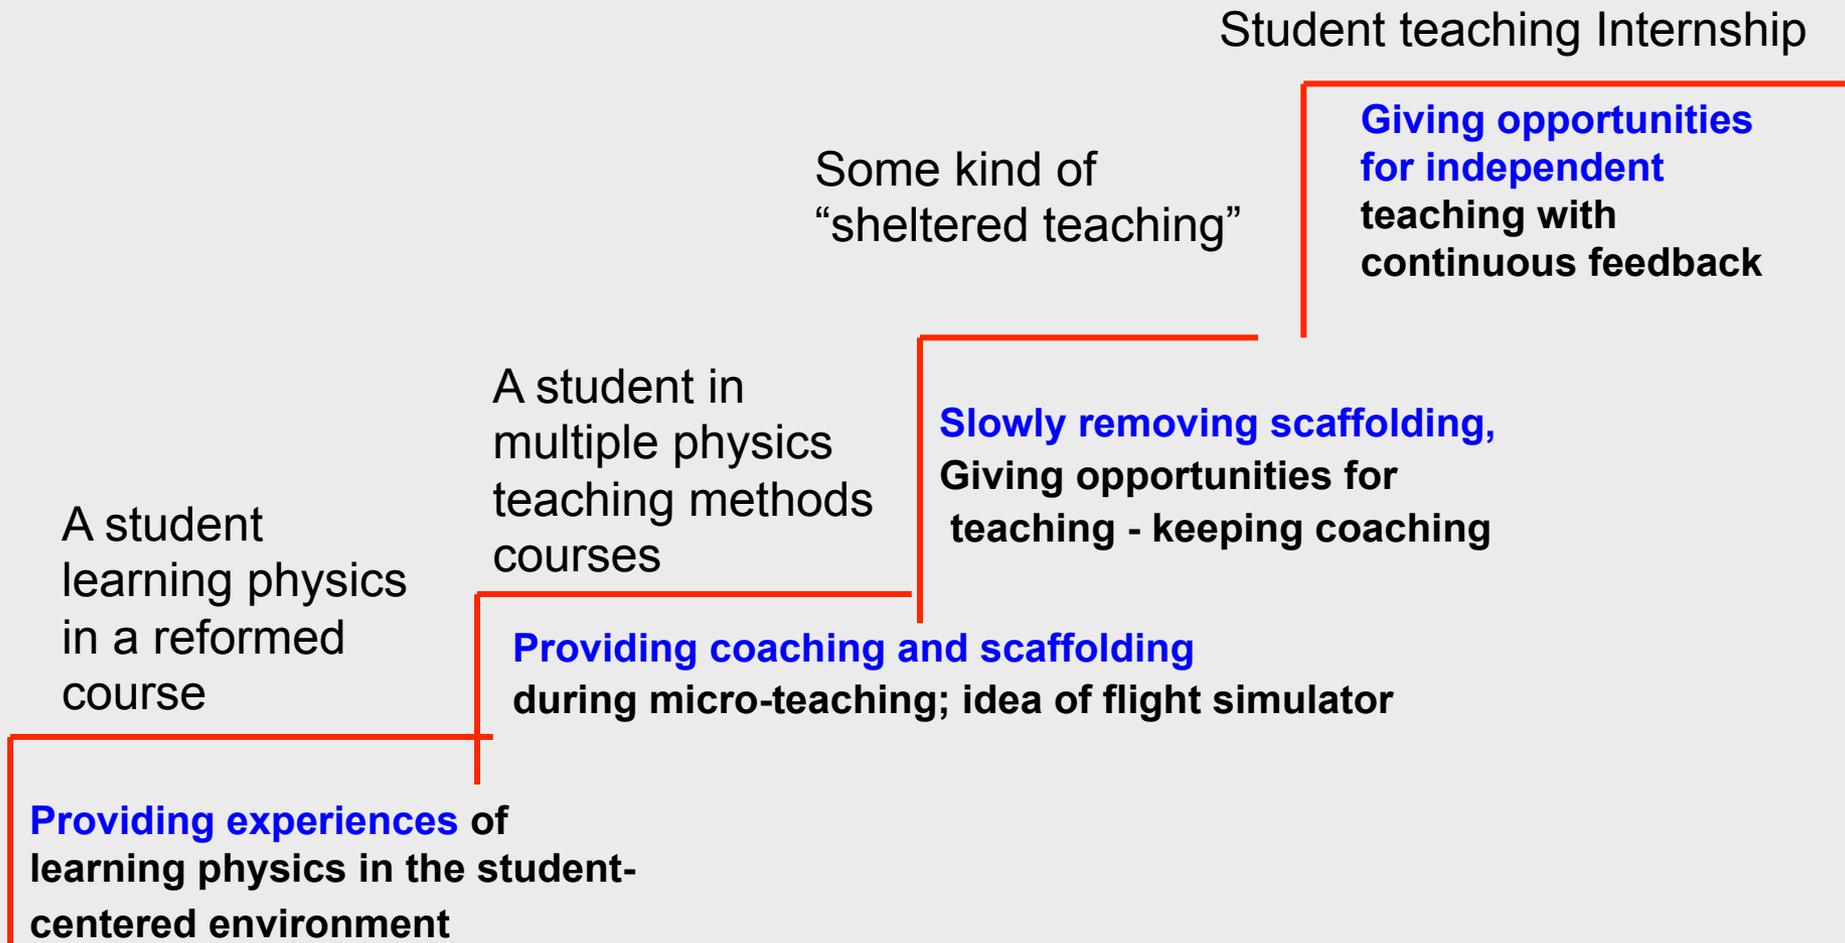

Slowly removing scaffolding

Providing coaching and scaffolding

Contexts that model proficiency

Collins, Brown and Newman, 1989.

Cognitive apprenticeship to become a new kind of teacher: course work and clinical practice

Cognitive apprenticeship approach to course work and clinical practice

Teaching practicum with supportive teachers

Teaching in reformed university courses

Giving opportunities for independent teaching with continuous feedback

A student in multiple teaching methods courses

Slowly removing scaffolding, Giving opportunities for sheltered teaching - keeping coaching

A student learning physics

Providing coaching and scaffolding during micro-teaching

Providing experiences of learning physics in the student-centered environment

Cognitive apprenticeship approach to course work and clinical practice

Teaching practicum with supportive teachers

Teaching in reformed university courses

Giving opportunities for independent teaching with continuous feedback

A student in multiple teaching methods courses

Slowly removing scaffolding, Giving opportunities for sheltered teaching - keeping coaching

A student learning physics

Providing coaching and scaffolding during micro-teaching

Providing experiences of learning physics in the student-centered environment

Reforms in undergraduate physics courses: creating an ISLE-based introductory physics course

Students learn physics by following ISLE process working in groups designing their own experiments

Examples of ISLE labs

Design an experiment **to find** a relation between a potential difference across and current through a commercial resistor.

Design an experiment **to test** whether this relation applies to an incandescent light bulb.

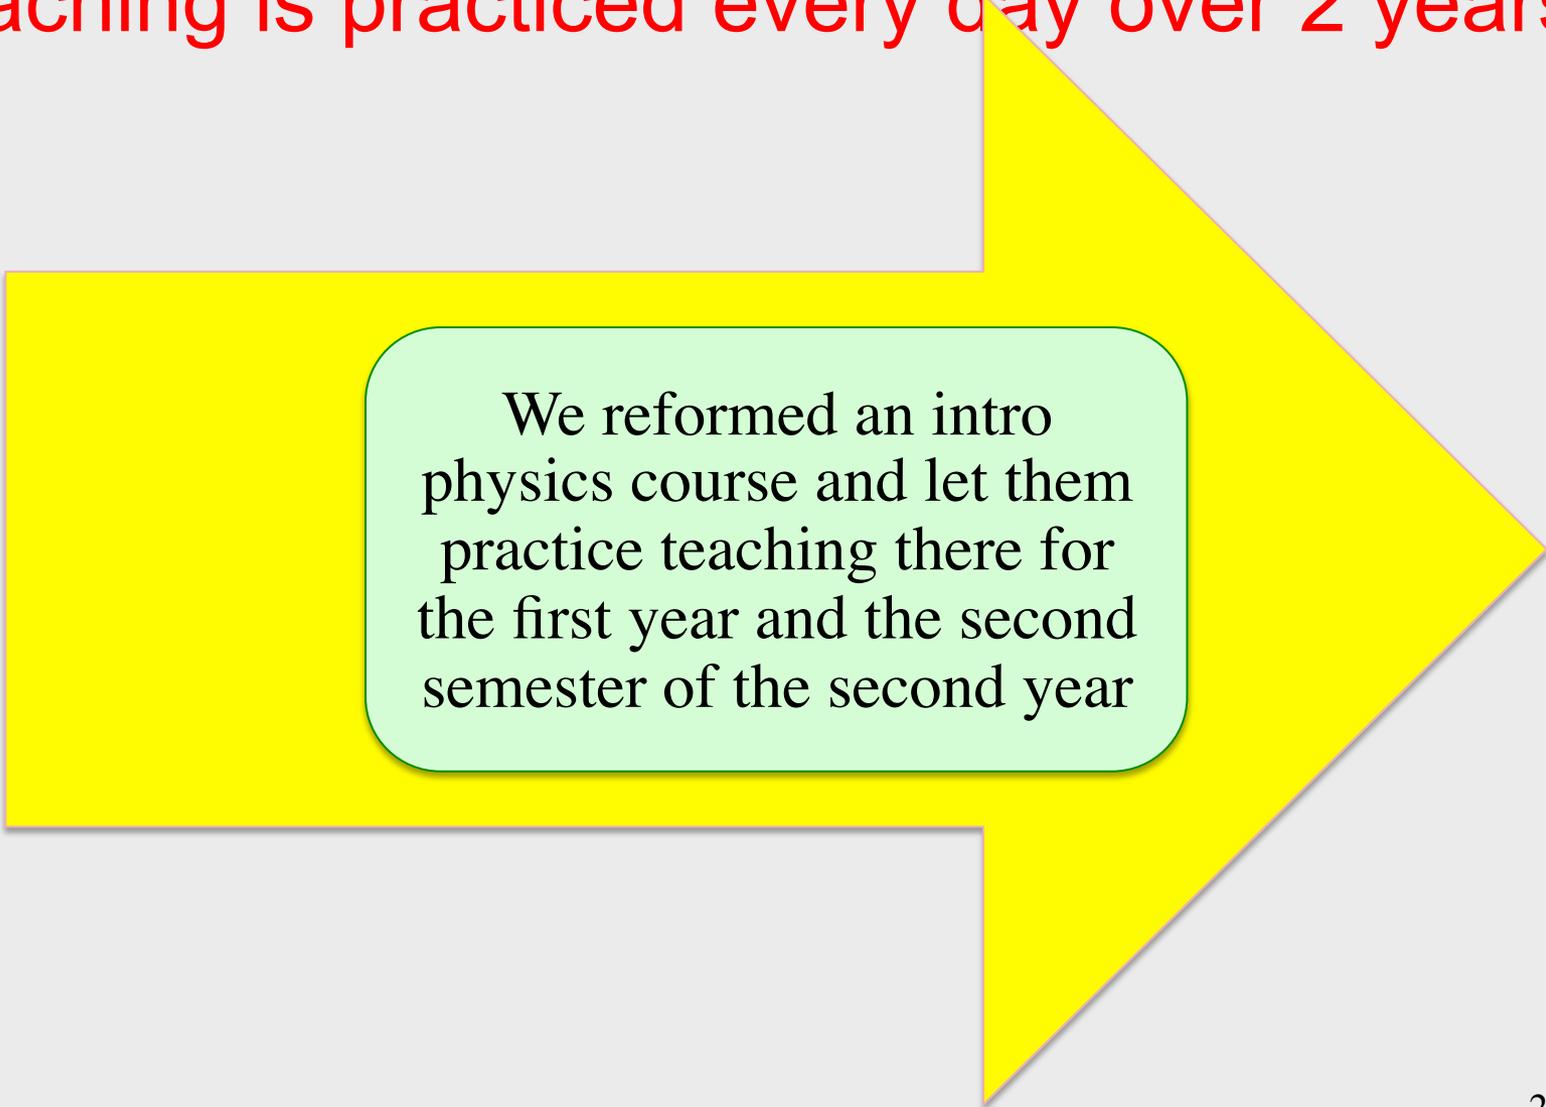

Design experiments **to determine** which of the 3 9-V batteries is better (one of them should be an Energizer battery).

Use the list of available equipment (xx, xx) **to pose your own scientific question**. Investigate the question and write a report.

Experiencing reformed teaching as a learner is a necessary condition but it is not sufficient.

One needs to practice it as much as possible.

How we make sure that student-centered teaching is practiced every day over 2 years

We reformed an intro physics course and let them practice teaching there for the first year and the second semester of the second year

How we make sure that student-centered teaching is practiced every day over 2 years

We reformed an intro physics course and let them practice teaching there for the first year and the second semester of the second year

We let them observe methods courses instructor and other teachers practice this new teaching and engaged them in microteaching

How we make sure that student-centered teaching is practiced every day over 2 years

We reformed an intro physics course and let them practice teaching there for the first year and the second semester of the second year

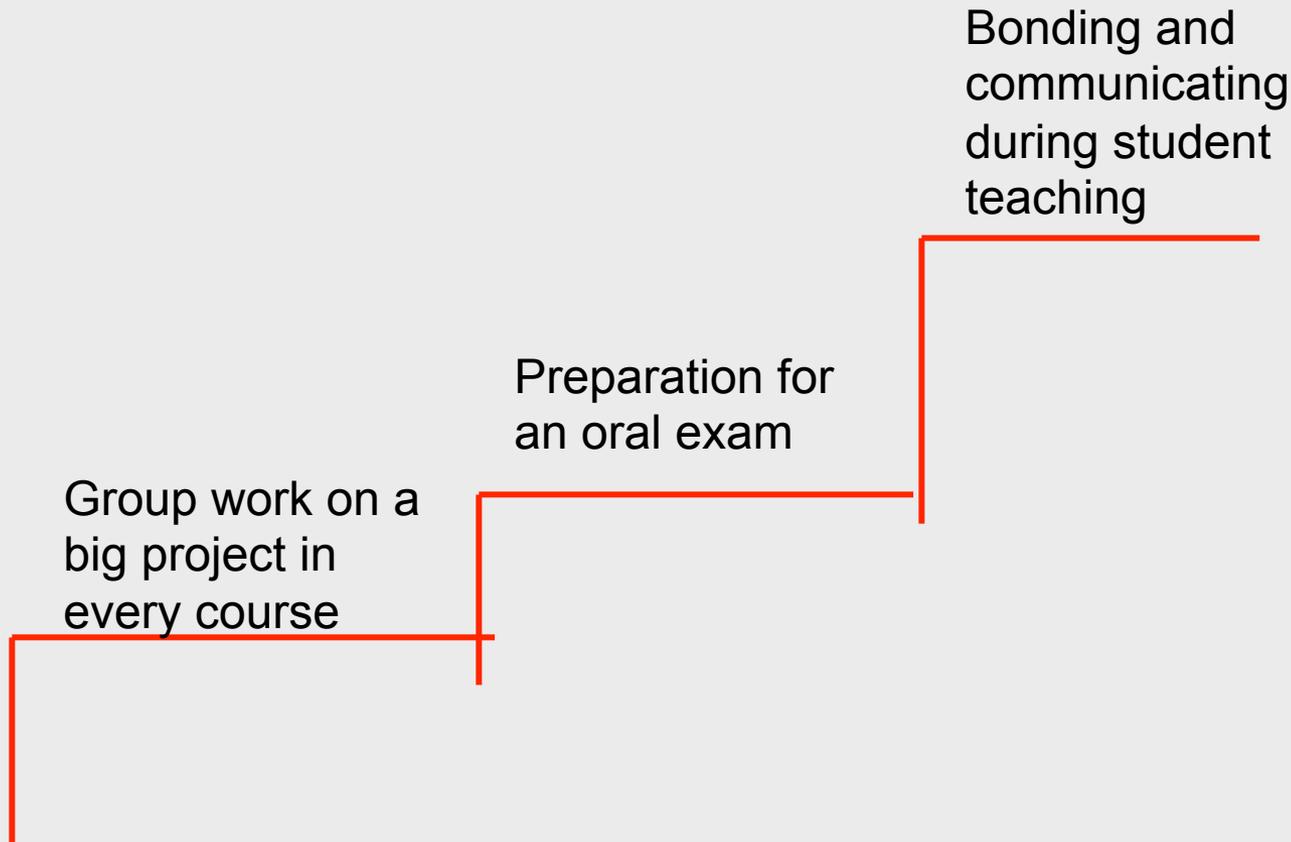

We let them observe methods courses instructor and other teachers practice this new teaching and engaged them in microteaching

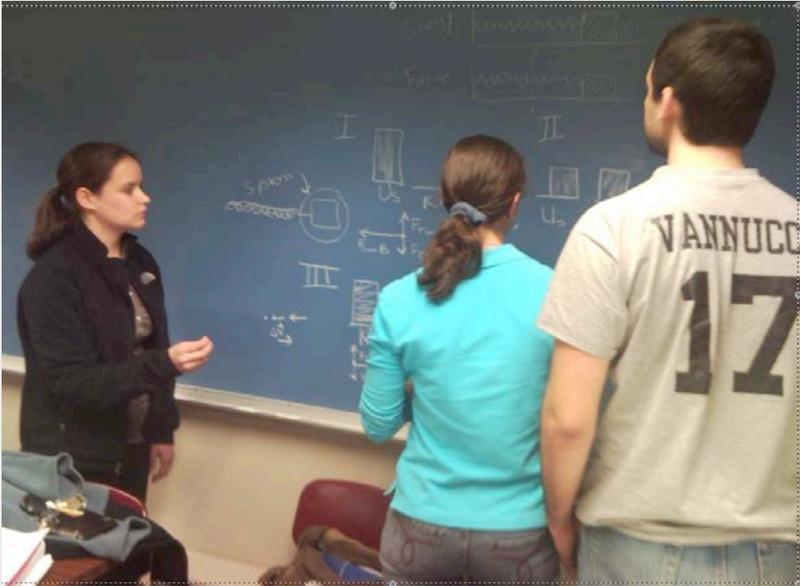

We place them for student teaching internship for 1 semester with the teachers who practice the same way of teaching

Issue #3

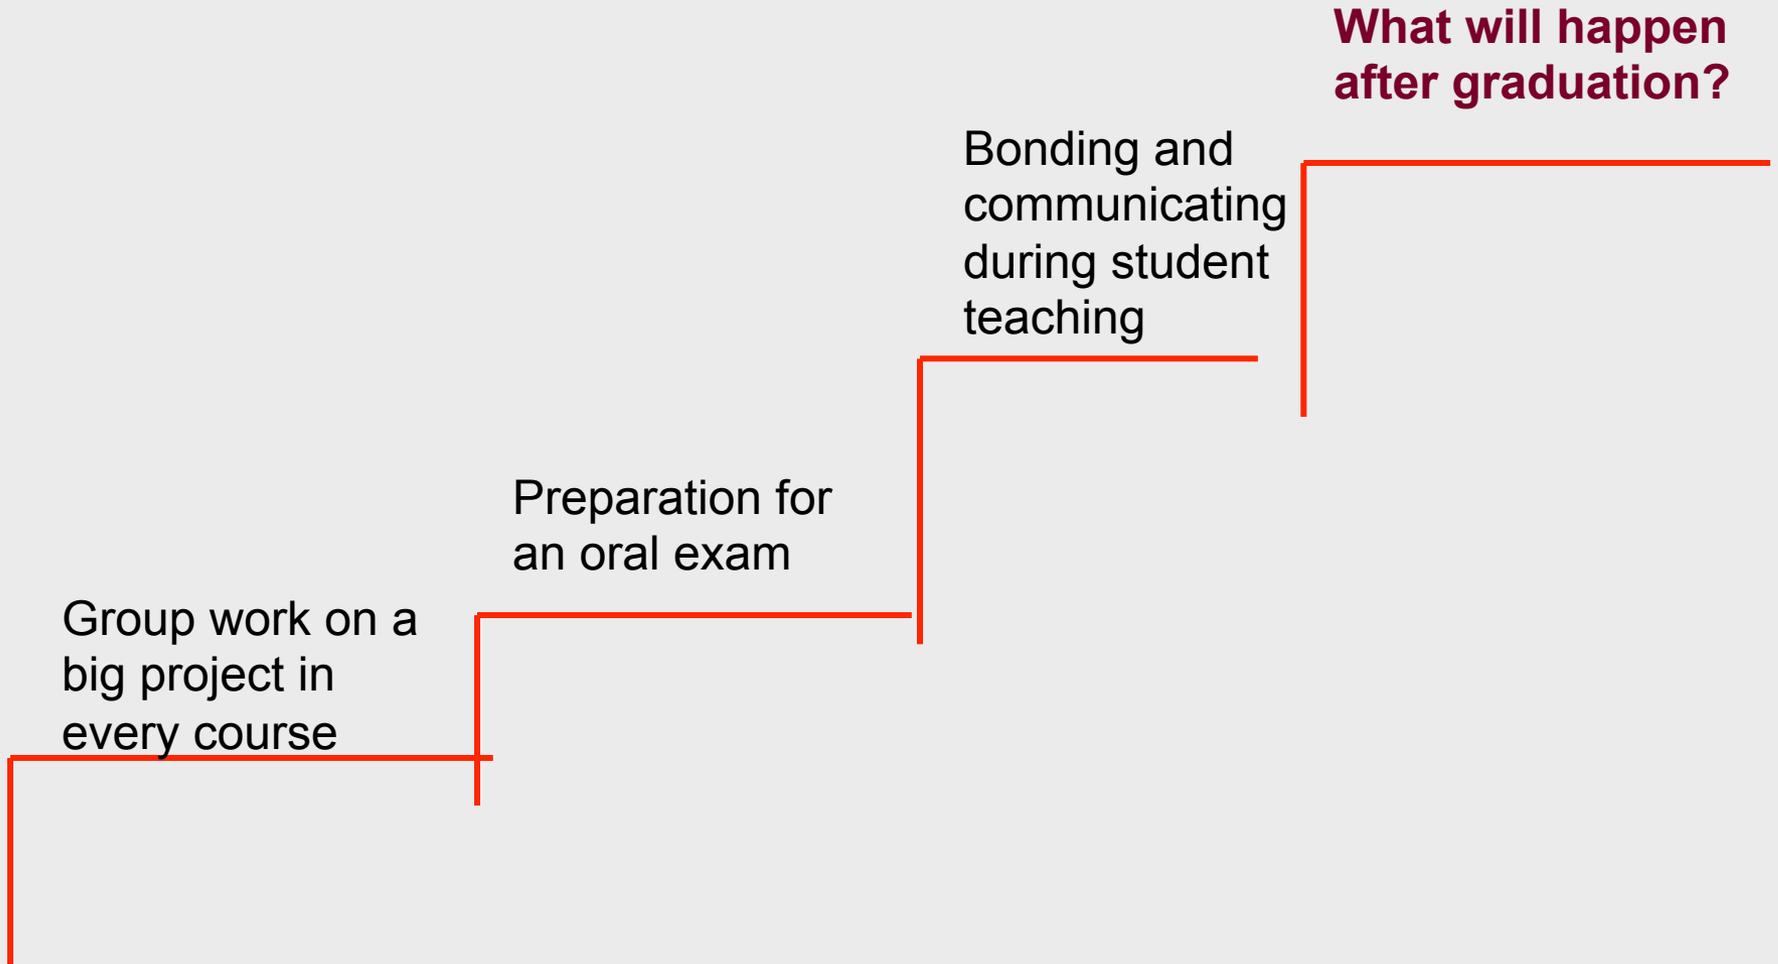

The feeling of isolation is one of the primary reasons for teachers to leave the profession (Darling-Hammond, 2001).

Building a Learning community

Building a Learning community

Helps new teachers survive

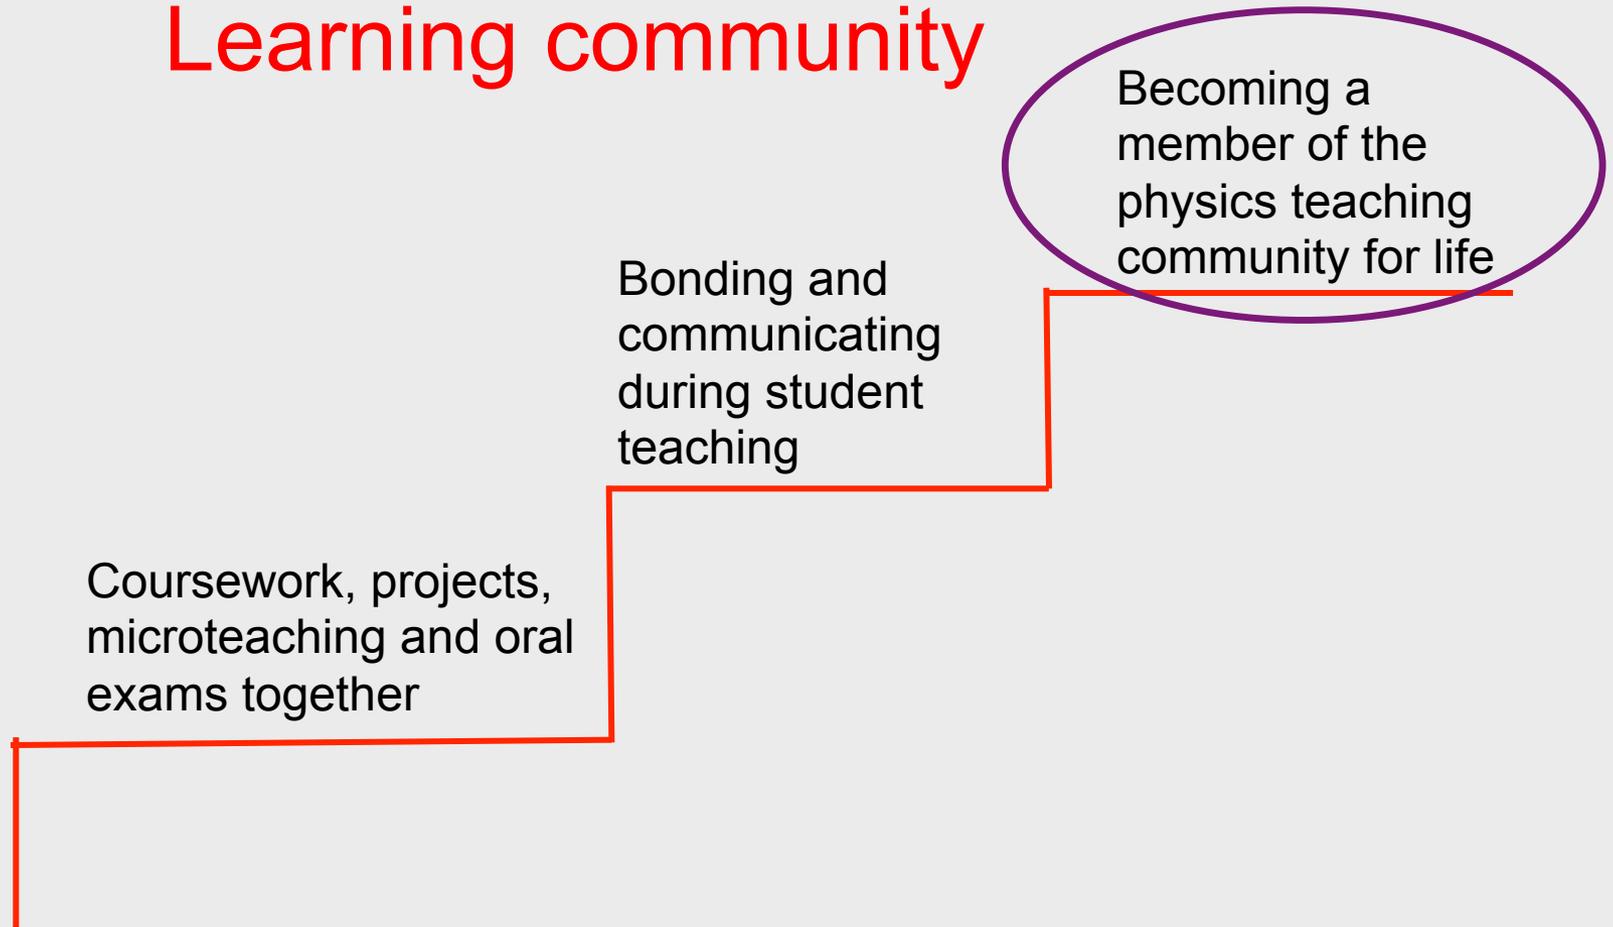

Builds relationships with them so when they are tenured they can become cooperating teachers

Creating a community of the graduates

Interns can practice during student teaching what they learn in the program

Cooperating teachers can reflect on their own teaching and also contribute to the development of the program

Learning community

How do you make a learning community?

Real? Virtual?

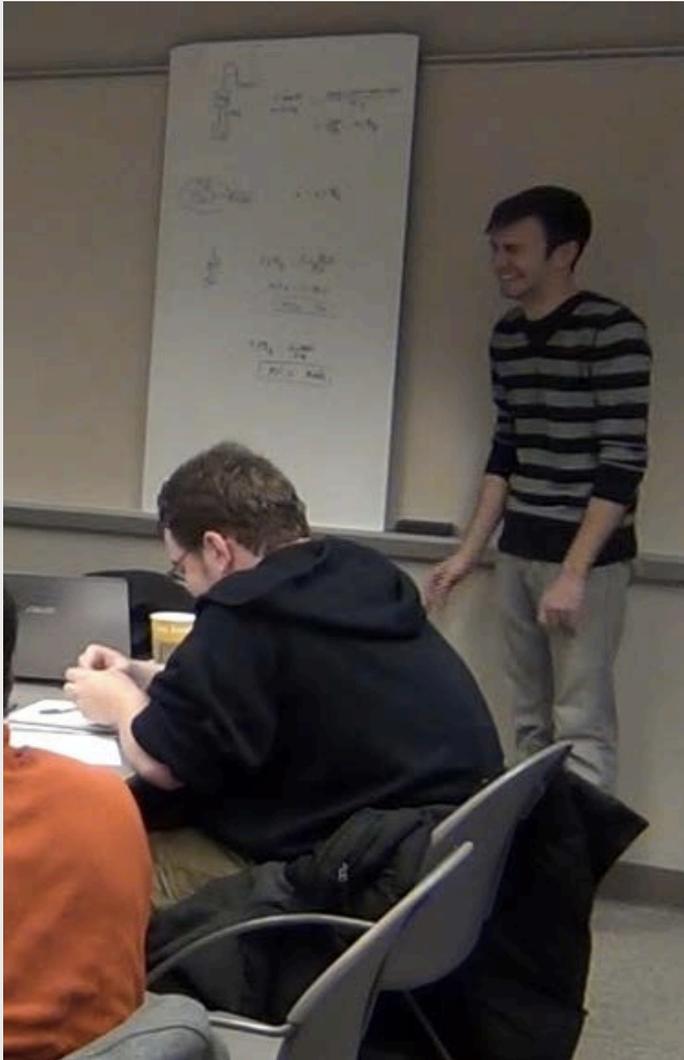

Funding?

Release time?

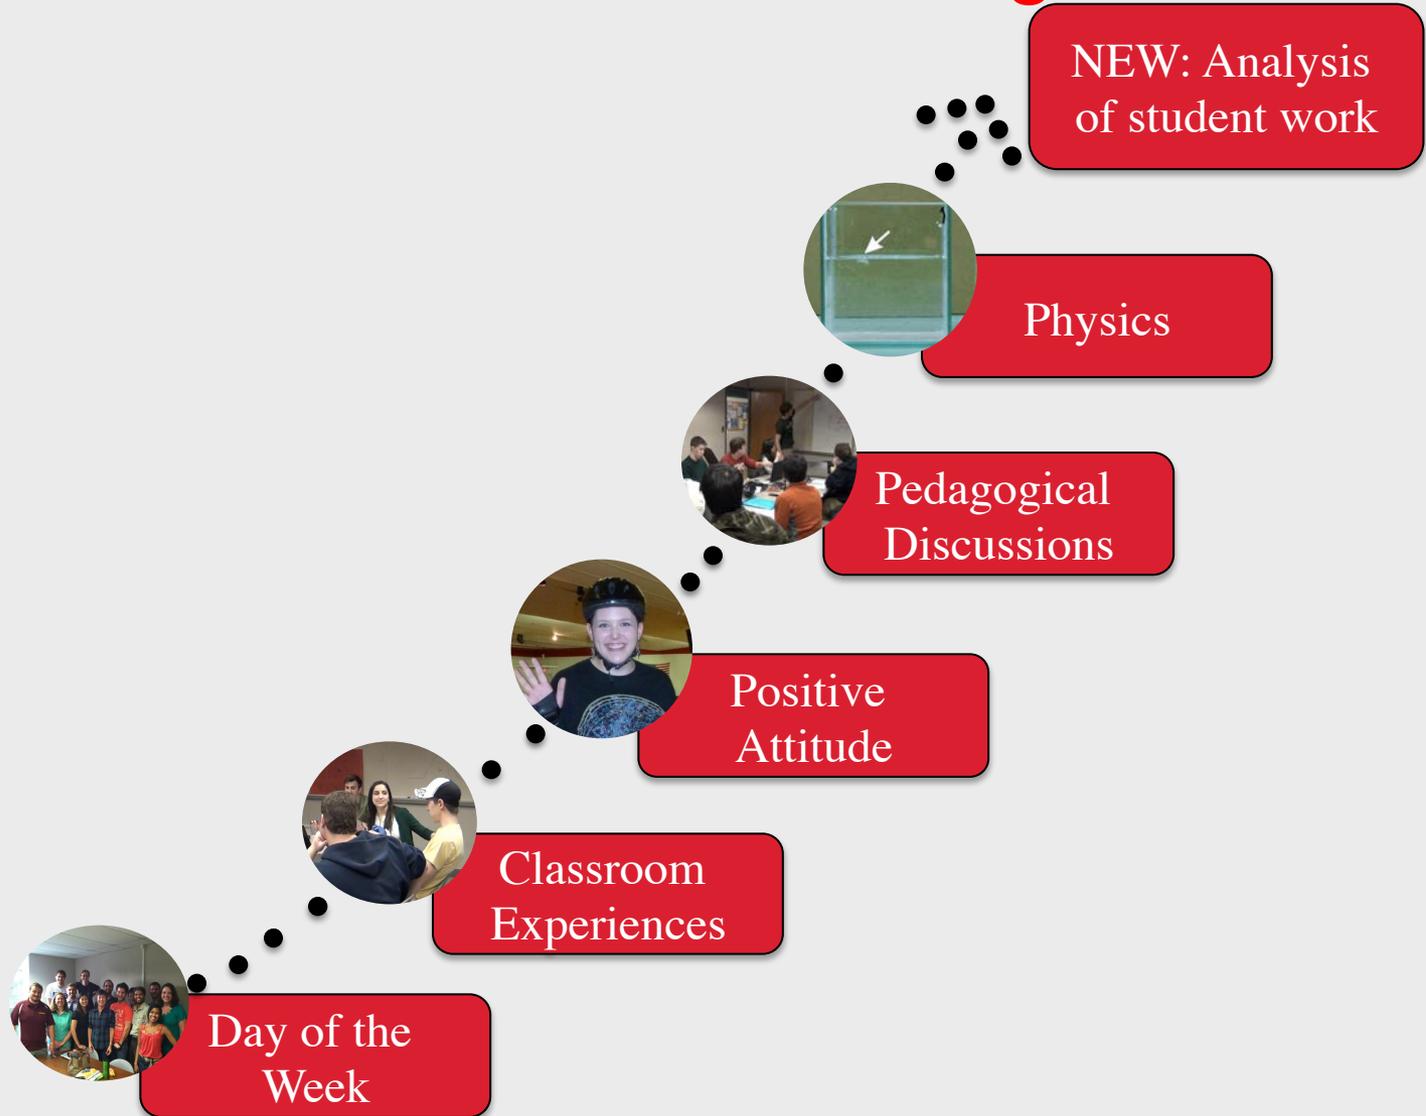

Teacher pay?

Meetings in person

Working together as they are used to

Evolution of the Meetings

Teachers Miss Physics...

Why does a balloon make a loud sound when you pop it?

Physics: Teachers Contribute

Tovi Daniel Spero

November 15

Here are the movie links I had for us at the meeting last night. If course I use more but this is just a few I use during the year.

One of Friday night meetings

Teacher-Led Workshops: Standards Based Assessment

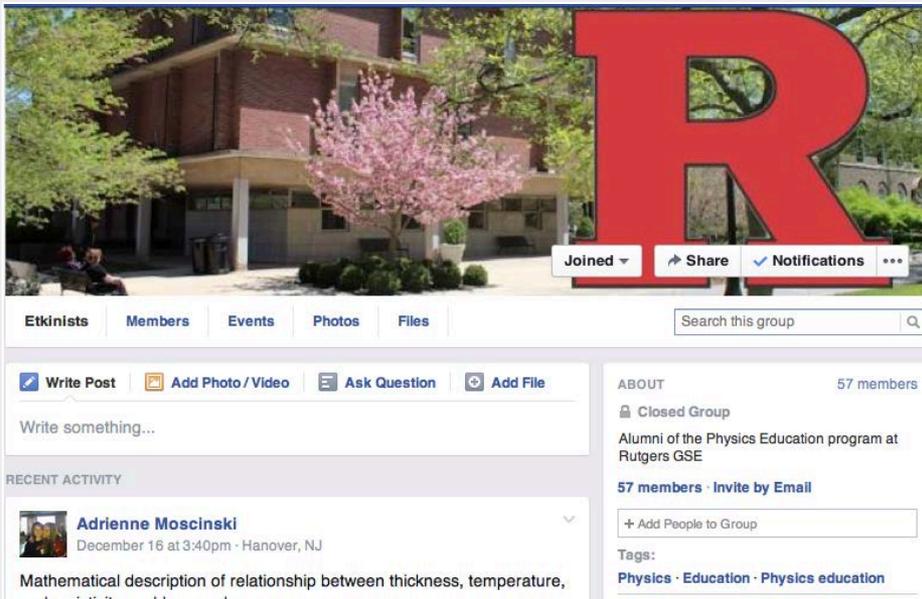

A long time ago I devised a method of teaching mechanics or rollerblades.

Not only do I practice this method in the classroom with future teachers but we also rent a rink once a year to help them learn technical details.

[etkinists] Heat Engines Efficiency

November 12, 2014 10:33 PM

[Inbox - Verizon](#)

I'm a little confused about heat engines. They've never been my strong point at all, and this is my first time teaching them in AP2.

According to the books, Efficiency is W done by the gas / Q in.

Work done by the gas then get defined as $Q_{in} - Q_{out}$.

I understand that, but it's not consistent with something else.

Brian, awesome discussion, this is how I see it:

for $Q_{in} = W + Q_{out}$, $+W$ refers in this case to work done by the gas on the environment. The return of the gas to its original state is not considered.

Take for example a simple steam turbine. Steam in provides the Q_{in} . W out is the spinning blades, Q_{out} is contained in the exhaust steam.
 $Q_{in} = W + Q_{out}$.

OVER 60 messages per month beginning 2004; over 80 members; meetings twice a month (from 4 to 25 teachers).

Just this past Friday I had 17 people staying from 4:30 pm to 7 pm. It was 1 am in Slovenia and they were in the School of Education in New Jersey or joining remotely

How do these experiences affect my
teachers?

Danielle Bugge, graduate of 2010

Rich Therkorn, 2006 Graduate, her cooperating teacher during student teaching

Walter Zubrzycki, 2014 Graduate

Danielle Bugge, 2010 Graduate

Danny Sierzega, 2011 Graduate

Creating a mini-community in their school

**A happy high
quality physics
teacher – a
member of the
community of like
minded**

**Community-
based striving
physics teacher
preparation
program**

**Graduates of the
program-physics
teachers and their
school districts**

**Physics
department
willing to change
its courses and to
trust future
teachers to teach**

Rutgers program graduates 6.3 physics teachers every year since 2004

Is 6.3 physics teachers per year a small or a big number?

What is the US average?

0 - 1.....

Are they good teachers?

80 observations of their teaching in the schools – they do in fact PRACTICE STUDENT CENTERED INSTRUCTION! (we use RTOP)

They have excellent gains on standardized physics tests. (FCI and CSEM – H-gains of 0.4-0.6)

Enrollment in physics in their schools increases.

They participate in the development of new curriculum materials (<http://pum.rutgers.edu>) and teach some of the courses in the program.

AND THEY DO NOT QUIT – the retention rate is over 85% after 5 years.

What does it mean for us?

Yes, we can prepare teachers to teach physics in the 21st century.

But there is no end to teacher preparation program.

Thank you!
